

How Many Tiles are there per Sq Metre

To work out how many tiles there are in one square metre you must multiply length x breadth of the tile in question.

Then divide 1 as in 1m^2 by your previous answer.

E.g $300 \times 300 = 0.09$ and $1 \div 0.09 = 11.11$

Size of the Tile length x breadth	Quantity of Tiles in one square metre
100 x 100	100
300 x 300	11.11
305 x 305	10.75
400 x 400	6.25
406 x 406	6.06
600 x 300	5.55
600 x 400	4.17
610 x 406	4.04
500 x 500	4
600 x 600	2.78
610 x 610	2.69

This is a useful calculation for working out how many tiles you will have on your job. For instance if you require 50m^2 of $406 \times 406 \times 12\text{mm}$ tiles, then you multiply 50×6.06 which is the number of tiles in one m^2 . The result is 303 tiles. A lot of fetching and carrying.

You can also work out from this the volume, which you may need to set aside an area on site for storage.

Volume is Area x depth. The area of one $406 \times 406\text{mm}$ tile is 0.1648m^2 . Multiply this by the depth of the tile which is 0.012 metres and you get 0.001978. Then multiply this by the number of tiles you have and the result is 0.599 cubic metres. Not a lot really.
